Subject: $\quad$ Final Memorandum - Existing Conditions Analysis (Task 4.2)

This memorandum summarizes the transportation inventory and identification of existing needs in support of the Terrebonne Refinement Plan (TRP). The majority of the inventory and analysis results are presented in figures and tables, with supplemental text provided to explain the illustrated information. Detailed operational analyses and data are provided in the supporting appendices.

The existing transportation needs, opportunities and constraints reflect an inventory of the multimodal transportation system characteristics conducted in the Spring of 2018. This inventory included all major transportation-related facilities and services within the Terrebonne Community (Terrebonne). Key roadway features, traffic and safety conditions at six study intersections and three roadway segments, bicycle facilities, pedestrian facilities, and transit facilities are analyzed. The memorandum is organized into the following sections:
Executive Summary .....  .2
Study Area and Land Use .....  3
Transportation Facilities .....  7
Existing Intersection and Street Operations ..... 17
Multimodal Gaps and Deficiencies ..... 26
Historic Crash Analysis ..... 31
Summary of Existing Conditions ..... 35

## EXECUTIVE SUMMARY

An assessment of the existing transportation system conditions and the transportation network inventory identified the following:

- US 97 is a key freight and statewide mobility route that traverse north-south through the Terrebonne Community. The highway also serves as a Tier 1, Phase 1 Lifeline Route considered vital for rescue and recovery operations in case of a natural catastrophe.
- Over Dimensional loads (OD) regularly used US 97 through Terrebonne. These vehicles typically average 120 feet in length, but can exceed 200 feet, including one OD load that was 330 feet.
- The pedestrian network throughout the urban area is largely incomplete. The only sidewalk facilities are present on B Avenue and a short segment of US 97. Nearly all higher order roadways scored a Level of Traffic Stress (LTS) 4 (high stress) with the exception of B Avenue.
- The existing B Avenue marked crosswalk at US 97 could possibly increase the risk of pedestrian related crashes if other pedestrian facility enhancements such as a Rectangular Rapid Flashing Beacon (RRFB) are not installed.
- The only dedicated bicycle facility in the community include bike lanes on a segment of US 97 between C Avenue and $11^{\text {th }}$ Street. The remainder of the community relies on paved shoulders for bicycles. The Oregon Scenic Bikeway that bisects the community east-west does not have dedicated bicycle facilities.
- The following three study intersections did not meet mobility targets for the side-street turning movement:
- US 97/Lower Bridge Way
- US 97/C Avenue
- US 97/B Avenue
- The US 97/Smith Rock Way (B Avenue) intersection meets mobility targets under typical conditions analyzed in this memorandum, though the $95^{\text {th }}$ percentile queue for the westbound approach extends through the $11^{\text {th }}$ Street intersection. Also, this intersection experiences high demand during seasonal events associated with agricultural and recreational amenities to the east.
- Segment volumes indicated that US 97 is currently under capacity through the study area.
- Speed data collected at three segments showed that the $85^{\text {th }}$ percentile speeds on US 97 at Lower Bridge Way and C Avenue exceed the posted speed by 19 and 3 mph , respectively.
- Ninety-three (93) crashes were reported in the greater Terrebonne area during the fiveyear study period. There were no fatal crashes during the study period.
- Of the six study intersections, US 97/Lower Bridge Way and $11^{\text {th }}$ Street/Smith Rock Way exceed the ODOT Critical Crash Rate over the past five-year period.

## STUDY AREA AND LAND USE

Terrebonne is an unincorporated community within Deschutes County which includes several local businesses, homes, and a local school. According to the US Census Bureau, the 2010 population estimate for Terrebonne was 1,257 residences. Terrebonne represents approximately $8 \%$ of Deschutes County's total population. Crooked River Ranch, which has approximately 5,000 residents, and other residential areas in Deschutes County and Jefferson County are located to the west and generally access US 97 via the US 97/Lower Bridge Way intersection at the northern end of Terrebonne.

Basic services are provided within Terrebonne, including a grocery store, hardware store, several restaurants, and other retail options are illustrated in the study area map (see Figure 1). This includes key activity locations, emergency response buildings, historical sites, hazardous material sites, and wetlands.

More expansive services and amenities are available in the neighboring communities of Madras and Redmond, which may require regular travel to these areas for residents of Terrebonne and the surrounding community. Recreational areas, including seasonal agricultural tourism such as the annual pumpkin patch at Smith Rock Ranch ${ }^{1}$ and DD Ranch ${ }^{2}$, and Smith Rock State Park, are to the east and generally access US 97 via the Smith Rock Way (B Avenue) intersection.

Figure 2 illustrates the location of several key businesses in Downtown Terrebonne, fronting US 97. There are a variety of commercial and service facilities along the corridor. Figure 3 shows the Deschutes County Zoning Map for the region. The Terrebonne commercial area is located along US 97 and $11^{\text {th }}$ Street between Lower Bridge Way and NW $10^{\text {th }}$ Street and is surrounded by residential zoning. Outside of this area, Terrebonne consists primarily of agricultural and farm zoning.

[^0]

Figure 1

Figure 2

## TRANSPORTATION FACILITIES

This section includes the roadway and multimodal transportation facilities provided in Terrebonne. The Community's connectivity and transportation network has largely been shaped by the presence of US 97 and the BNSF railroad located to the east. The County and ODOT have classified streets into functional classification based on a hierarchy of multimodal mobility and access to, through and between different land use types. The roadway ownership map is shown in Figure 4. Roads ownership in the area is summarized below:

- ODOT: owns and maintains US 97
- Deschutes County: owns and maintains key roadways in Terrebonne, including $11^{\text {th }}$ Street, B Street, Smith Rock Way, C Street, and Lower Bridge Way
- Local Access Roads: roads that the public has right to use, but are not maintained by ODOT, Deschutes County or any other government agency
- Private Roads: roads that are owned and maintained by local property owners or associations.

- State Local Access Road
—— County —— Private

Figure 4

## State Highways

US 97 is a statewide highway and designated freight route that provides north-south access between northern California and into Canada via Washington State. It is the primary highway serving Terrebonne and generally divides the community with residential and commercial uses on both the east and west side. The highway also serves as a Tier 1, Phase 1 Lifeline Route considered vital for rescue and recovery operations in case of a natural catastrophe. US 97 is a key connection to the Redmond Municipal Airport, identified as a primary emergency response airport in Central Oregon.

Providing adequate access to streets, land uses, and key destinations is a critical part of operating and planning for an effective transportation system for all users. ODOT maintains standards to help balance the needs for both "through travelers" (including freight and public transportation) as well as serving the needs of area residents, businesses, and visitors. US 97 is identified in the Oregon Highway Plan (OHP) as a Statewide Highway and includes Expressway designation immediately north and south of Terrebonne. The Expressway designation does not carry into the Terrebonne urban area between Lower Bridge Way and NW $10^{\text {th }}$ Street. The following subsections identify current standards for US 97.

## Intelligent Transportation Systems

Speed feedback signs are located on US 97 as drivers enter Terrebonne from the north and south. No other Intelligent Transportation System (ITS) facilities exist in or near the community.

## Culverts

There are no culverts located within the study area on US $97^{3}$. A culvert is located approximately 0.75 mile north of Lower Bridge Way and 0.75 mile south of NW $10^{\text {th }}$ Street.

## Posted Speeds

A map indicating the posted speed on US 97 is shown in Figure 6. North of Terrebonne the posted speed on US 97 is 65 mph . The speed limit is reduced in several phases when entering Terrebonne. The posted speed is 55 mph south of Terrebonne until reaching the Redmond City limits, where the speed is reduced. The Terrebonne urban core has a posted speed of 35 mph between Central Avenue and $11^{\text {th }}$ Street.

## Access Management Standards

ODOT specifies access management spacing standards in the OHP and OAR 734-051-4020(8). The applicable access management spacing standards for state facilities in a rural area are summarized in

[^1]Table 1. These standards are based on the 2018 AADT (Annual Average Daily Traffic volume), posted speed limit, and functional classification.

Table 1: ODOT Access Management Spacing Standards for Highway Segments

| Route <br> Name | Facility Extents | Facility Designation | 2017 <br> AADT | Posted Speed Limit <br> (mph) | Access Spacing Standard <br> (feet) |
| :---: | :--- | :--- | :---: | :---: | :---: |
| US 97 | Section south <br> of Lower <br> Bridge Way <br> and north of <br> NW 10 <br> Street | Statewide <br> Freight Route; <br> Rural Area | $>5,000$ | $35 / 45 / 55$ | $770 / 990 / 1320$ |

AADT = Average Annual Daily Traffic
$\mathrm{mph}=$ miles per hour
Source: Oregon Highway Plan, Appendix C Revisions to Address Senate Bill 264 (2011) Table 14
Thirteen access driveways on US 97 between Lower Bridge Way and NW $10^{\text {th }}$ Street were identified. There are two areas where access spacing is less than the standard: two private access points on the west side of US 97 between B Avenue and C Avenue (approximately 60 feet) and three access points on the east side of US 97 between South $11^{\text {th }}$ Street and B Avenue that are approximately 50 feet apart.

## Access Permits

Figure 5 shows the ODOT access permit locations along US 97. As shown, access points through Terrebonne are a mix of public and private permits, with the highest concentration located between $11^{\text {th }}$ Street in the south to Central Avenue in the north.

## Pavement Condition

Based on ODOT databases ${ }^{4}$, the pavement condition on US 97 between Lower Bridge Way and NW $10^{\text {th }}$ Street is in fair condition. Additionally, ODOT is currently in the construction phase of a repaving project on US 97 between US 26 and NW $10^{\text {th }}$ Street. The project will include repaving and updated pavement markings in the Terrebonne area.

## Freight Mobility

As previously stated US 97 is classified as a primary statewide freight corridor and is part of the state's freight network. As shown in Figure 9 below, approximately 20-30\% of the vehicular traffic on US 97 in Terrebonne is classified as heavy vehicles. Additional heavy vehicle information is provided in the Heavy Vehicle Observations section below. There are no other identified freight routes in the study area.

[^2]

Posted Speed $\mathbf{( m p h}) \quad 20-25-35-45=55$

Figure 6

## Deschutes County Facilities

Deschutes County owns and maintains most primary roadway connections in Terrebonne with expectation to US 97 (see Figure 4). Table 2 illustrates the functional classification of prominent roadways in Terrebonne. This includes Lower Bridge Way, $11^{\text {th }}$ Street, B Avenue/Smith Rock Way, $19^{\text {th }}$ Street and C Avenue. County maintenance operations includes repairing roads, removal or roadside hazards, vegetation control, and winter maintenance. Local access roads are facilities that the public has right to use but are not maintained by Deschutes County or any other government agency. These roads can be maintained either privately or through a Special Road District. Crooked River Ranch adopted a Special Road District in June 1983.

Table 2. Deschutes County Functional Classification

| Functional Classification | Description | Example Roadway Applied To |
| :--- | :--- | :--- |
| Principal Arterial | Statewide highways that serve <br> major activity centers in an <br> urban area. Carry the highest <br> portion of traffic entering, <br> leaving, and bypassing the <br> urban area. | US Highway 97 |
| Urban and Rural Arterial | Distributes vehicles to areas <br> without penetrating specific <br> neighborhoods. Provides <br> services within urban area at a <br> lower mobility. | Lower Bridge Way, Smith Rock <br> Way* |
| Urban and Rural Collector | Primarily serves residential <br> neighborhoods, commercial <br> districts and industrial areas to <br> distribute trips to their final <br> destinations. | C Avenue*, NW 19 ${ }^{\text {th }}$ Street |
| Urban and Rural Local | Lowest level of travel mobility <br> to provide access to individual <br> properties and developments. | 11 ${ }^{\text {th }}$ Street*, 5 ${ }^{\text {th }}$ Avenue |

Source: Deschutes County Transportation System Plan (2012)
*Urban designation

## 11th Street Roadway Condition

$11^{\text {th }}$ Street is classified by Deschutes County as an urban local roadway. It travels parallel to US 97 from Lower Bridge Way in the north to just south of the Terrebonne community business district (just south of A Avenue). $11^{\text {th }}$ Street serves both businesses and residents. There are over 20 driveway access locations along $11^{\text {th }}$ Street, which are shown in Figure 5. Most of these access points lack defined curb cuts, which can cause unclear transitions between the roadway and driveways or adjacent properties.

Pavement condition data was provided by Deschutes County Public Works Department. The pavement condition index is measured on a scale of 0 to 100 ( 0 indicating very poor condition and 100 indicating excellent condition). The pavement condition score for several high order county roads in Terrebonne are shown below:

- $11^{\text {th }}$ Street: 71 to 77
- C Avenue: 83
- Smith Rock Way: 81 to 82
- Lower Bridge Way: 83

## Active Transportation Facilities

## Pedestrian System

A complete pedestrian network contributes to the economic vitality, health, and equity for a community. The pedestrian network in Terrebonne largely consists of paved sidewalks on B Avenue and on US 97 within close proximity to the Terrebonne Community School, which were recently constructed as part of an ODOT improvement project. Other areas of Terrebonne rely on paved and gravel shoulders to support pedestrian activity.

Currently, a single marked crosswalk on US 97 is provided within the Terrebonne community at the US 97/B Avenue intersection. This crosswalk included an overhead flashing amber beacon. The beacon flashes regularly and is not pedestrian activated. The Terrebonne Community school is located two blocks to the west on B Avenue. Figure 7 illustrates the location of sidewalks, bike facilities and marked crosswalks.

A pedestrian crossing analysis was completed to evaluate whether the existing marked pedestrian crossing of US 97 at B Avenue should be enhanced. Table 11 of the Safety Effects of Marked Versus Unmarked Crosswalks at Uncontrolled Locations Final Report and Recommended Guidelines ${ }^{5}$ uses the roadway type (number of lanes and median type), vehicle ADT, and posted speed as contributing factors to considering a new marked crossing. US 97 is a two-lane road with vehicle ADT > 15,000 and a posted speed of 35 miles per hour at B Avenue. Based on this criterion, the existing B Avenue marked crosswalk could possibly increase the risk of pedestrian related crashes without other pedestrian facility enhancements such as a Rectangular Rapid Flashing Beacon (RRFB).

[^3]
## Bicycle System

Exiting bicycle facilities within the Community are also shown in Figure 7. As identified, 6-foot bicycle lanes are provided on US 97 between $11^{\text {th }}$ Street in the south and C Avenue to the north. The Oregon State Park Sisters to Smith Rock Scenic Bikeway is designated through Terrebonne along Smith Rock Way \& B Avenue (crossing US 97 at B Avenue) but does not have dedicated facilities along its route in the vicinity of the community.

## Public Transit System

The Terrebonne Community is currently served by the Cascades East Transit (CET) Community Connector Route 22 between Redmond and Madras. The route makes three stops throughout the day. The transit stop is located on the northeast corner of US97/C Avenue. The CET Master Plan identifies the need to develop a southbound bus pullout on the westside of US 97 with a signalized pedestrian crossing connecting to the Terrebonne Mini Market Park \& Ride.

Figure 7

## EXISTING INTERSECTION AND STREET OPERATIONS

As part of the inventory, existing operations at six key intersections were compared to the established performance standards to identify potential deficiencies in the existing system in Terrebonne.

## Analysis Methodology and Performance Standards

All operational analyses described herein are in conformance with State and County methodologies. More details on the analysis methodology can be found in Technical Memorandum \#2: Analysis Methodology \& Assumptions. Existing conditions operation worksheets can be found in Appendix B.

The operational results for the intersections and segments were compared with County and/or State performance standards to identify existing deficiencies. These standards are shown in Figure 11 and described in Table 3. ODOT defines intersection performance standards by "mobility targets" that are represented by a volume-to-capacity ratio. The County defines performance standards by "level-ofservice", which is a rating from A to $F$ to describe the experience of the user.

Table 3: Study Intersection Control and Mobility Target

| Study <br> Int. \# | Intersection | Classification/ <br> Jurisdiction | Intersection <br> Control | Performance Standard |
| :---: | :---: | :---: | :---: | :---: |
| 1 | NW 19 ${ }^{\text {th }}$ Street/Lower Bridge Way | County | Unsignalized | LOS D |
| 2 | US 97/Lower Bridge Way | ODOT | Unsignalized | Side-Street: $\mathrm{v} / \mathrm{c}<0.80$ <br> Mainline: $\mathrm{v} / \mathrm{c}<0.70$ |
| 3 | US 97/C Avenue | ODOT | Unsignalized | Side-Street: $\mathrm{v} / \mathrm{c}<0.80$ <br> Mainline: $\mathrm{v} / \mathrm{c}<0.70$ |
| 4 | US 97/B Avenue (Smith Rock Way) | ODOT | Unsignalized | Side-Street: $\mathrm{v} / \mathrm{c}<0.80$ <br> Mainline: $\mathrm{v} / \mathrm{c}<0.70$ |
| 5 | $11^{\text {th }}$ Street/Smith Rock Way | County | Unsignalized | LOS D |
| 6 | US 97/S 11 ${ }^{\text {th }}$ Street | ODOT | Unsignalized | Side-Street: $\mathrm{v} / \mathrm{c}<0.80$ <br> Mainline: $\mathrm{v} / \mathrm{c}<0.70$ |

## Roadway Segment Analyses

Segment data was collected at three locations along US 97 by tube counts for three days in April 2018 (provided in Appendix A). These traffic volumes were seasonal adjusted and used to conduct capacity analysis to determine how the facilities operate under $30^{\text {th }}$ Highest Hour conditions. Vehicle volumes, speeds, and classification information were all collected as part of the data. Figure 10 summarizes the measured peak period traffic volumes, as recorded in Spring 2018, and the resultant volume-tocapacity ratio. As shown in Table 4, the segments do not exceed capacity under $30^{\text {th }}$ Highest Hour Conditions today.

Table 4: Study Segment Analysis Results

| Roadway Segment | Direction | 2018 Daily <br> Traffic <br> Volumes | Peak Hour from 2018 Traffic Counts | Peak <br> Hour <br> Traffic <br> Volumes | Capacity <br> Estimate <br> (vphpl) | Calculated V/C Ratio |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| US 97 approx. 600 ft north of Lower Bridge Way | NB | 15,213 | 4:00-5:00pm | 584 | 1,700 | 0.34 |
|  | SB |  | 3:00-4:00pm | 640 |  | 0.38 |
| US 97 approx. 100 ft south of C Avenue | NB | 20,968 | 4:00-5:00pm | 902 | 1,700 | 0.53 |
|  | SB |  | 3:00-4:00pm | 786 |  | 0.46 |
| US 97 approx. 500 ft south of NW $10^{\text {th }}$ Street | NB | 22,614 | 4:00-5:00pm | 1,021 | 1,700 | 0.60 |
|  | SB |  | 3:00-4:00pm | 824 |  | 0.48 |

Note: Vehicles per hour per lane (vphpl)
As seen in Figure 8, weekday traffic volumes generally rise throughout the day and peak in the evening. There is also a slight peak in the morning around 7:00AM. All the count locations follow a similar traffic flow pattern. Volumes north of Lower Bridge Way are approximately $25 \%$ lower than the counts at C Avenue and NW $10^{\text {th }}$ Street. This is likely due to the demand to and from Crooked River Ranch and other destinations west on Lower Bridge Way.

Figure 8. Weekday US 97 Volume Profile in Terrebonne

## Lower Bridge Way Traffic Volumes

Peak hour traffic count data was collected at the intersection of Lower Bridge Way/US 97 in April 2018. Average Daily Traffic (ADT) was interpolated from the peak hour data ${ }^{6}$ and shows Lower Bridge Way carries approximately 5,990 ADT. This is approximately $30 \%$ of the daily traffic on US 97 . As shown, Lower Bridge Way is a well utilized road that provides a key connection to and from US 97 for residents and businesses to the west, including Crooked River Ranch.

## $85^{\text {th }}$ Percentile Speed Observations

Speed data was collected at the three tube count locations in Terrebonne over the course of three days in 2018 to assess typical speeds during the weekday. Speeds are generally analyzed in terms of the $85^{\text {th }}$ percentile speed, which is the speed which no more than $15 \%$ of traffic is exceeding. The $85^{\text {th }}$ percentile speed is generally used when setting speed limits. Table 5 provides a summary of the segment speed results. As shown, the average and $85^{\text {th }}$ percentile speeds are traveling as speeds higher than the posted speed north of Lower Bridge Way in both direction. The $85^{\text {th }}$ percentile speeds exceed the posted speeds in the commercial area near C Avenue in both directions. It should be noted that were the tube data was collected north of Lower Bridge Way is within 100 feet of the transition zone where the speed limit increases to 55 miles per hour. See Figure 6 for a posted speed map.

Table 5. Existing Segment Speed Results

| Location | Movement | ADT | Posted <br> Speed | Average Speed (mph) | 85 ${ }^{\text {th }}$ Percentile <br> Speed (mph) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| US 97 approx. 600 ft north of Lower Bridge Way | NB | 7,459 | 45 | 59 | 64 |
|  | SB | 7,755 | 45 | 54 | 60 |
| US 97 approx. 100 ft south of C Avenue | NB | 10,222 | 35 | 31 | 38 |
|  | SB | 10,750 | 35 | 28 | 37 |
| US 97 approx. 500 ft south of NW $10^{\text {th }}$ Street | NB | 11,186 | 55 | 43 | 49 |
|  | SB | 11,433 | 55 | 45 | 53 |

[^4][^5]
## Heavy Vehicle Observations

Vehicle classification data was collected at the three tube count locations. Figure 9. shows the average types of vehicle on US 97 at the various locations. US 97, as shown, is a high frequency freight corridor. Detailed heavy vehicle information is included in the traffic counts provided in Appendix A.

## Over Dimensional Loads

ODOT records on Over Dimensional (OD) loads from 2013-2015 and November 2017 to August 2018 show that US 97 through Terrebonne typically sees 1-2 OD loads per month, with a higher concentration occurring in the Spring, Summer, and Fall. Few OD loads occur in the winter. OD loads during these time periods averaged about 120 feet in length but included several OD loads over 200 feet in length, including a load 330 feet long in July 2014. The average width of OD loads was about 18 feet, with some loads as wide as 26 feet. Table 6 provides a general summary of OD loads during these periods. Appendix H includes the supporting over dimensional load data.

Table 6: Over Dimensional Loads on US 97 Near Terrebonne (2013-2015, November 2017-August 2018)

| Number of Loads | Total | 90 |
| :--- | :---: | :---: |
| Width | Average | 18 feet |
|  | Max | 26 feet |
| Length | Average | 116 Feet |
|  | Max | 330 Feet |
|  | Average | $220,000 \mathrm{lbs}$ |

Figure 9

Vehicle Classification

## Intersection Traffic Operations Analysis Results

Six study locations were evaluated to assess intersection operations and turning movements onto and off US 97 and at other key intersections within the study area. The traffic counts were collected in April 2018. The existing counts were seasonally adjusted as documented in Technical Memorandum \#2. Appendix D also contains detailed information about intersection operations and queuing under existing conditions.

As shown in this analysis, turning movements from the side-street experience significant delays today, especially for left-turn movements from the side-street onto US 97. Because of these delays, users are likely altering their route, potentially the time of day they travel, to avoid left-turns or congested intersections. Feedback from the community during Open House \#1 confirmed this assumption (see Open House \#1 Comment Report). Additionally, the $95^{\text {th }}$ percentile queue for the westbound movement at US 97/B Avenue exceeds the mid-block spacing requiring vehicles to queue on the east side of $11^{\text {th }}$ Street. This intersection also experiences seasonal traffic congestion and queues associated with the areas to the east of Terrebonne.

Figure 10 illustrates the existing peak hour traffic volumes and lane configurations and Figure 11 illustrates the results of the peak hour intersection operations. Figure 12 illustrates the existing $95^{\text {th }}$ percentile queue at the study intersections.

## MULTIMODAL GAPS AND DEFICIENCIES

The following section documents gaps and deficiencies in the existing pedestrian and bicycle system. A gap is defined as a missing link in the network, such as an identified key walking or biking route is missing sidewalk or designated bicycle facility. A deficiency is defined as a pedestrian or bicycle facility that does not meet the standard or is insufficient to meet the users' needs. Examples of deficiencies include:

- Locations with documented pedestrian and bicycle crash histories
- On-street connections that have a Bicycle Level of Traffic Stress greater than 2
- On-street connections that have a Pedestrian Level of Traffic Stress greater than 2

## Pedestrian Facility Gaps and Deficiencies

Streets with no sidewalks or intermittent sidewalks force pedestrians to walk along the edge of the road, use the shoulder if available, or simply not make their intended trip by walking. In many cases, the absence of sidewalks or intermittent sidewalk facilities increases the number of vehicles on the road by forcing pedestrians to drive to accomplish short distance trips due to the increased stress resulting in lack of separation between the vehicular traffic and pedestrian space. In Terrebonne, sidewalk facilities are present on B Avenue near Terrebonne Community School and on US 97 between Central Avenue and $11^{\text {th }}$ Street. The remainder of the pedestrian network remains incomplete.

## Pedestrian Level of Stress

Pedestrian facilities located along key roadways were evaluated to identify potential issues that could be addressed as part of the Refinement Plan. The ODOT Analysis Procedures Manual (APM) provides a methodology for evaluating pedestrian facilities called Pedestrian Level of Traffic Stress (PLTS). This methodology classifies four levels of traffic stress that a pedestrian can experience on the roadway, ranging from PLTS 1 (little traffic stress) to PLTS 4 (high traffic stress). Per the APM, PLTS 2 is considered a reasonable target for most pedestrian facilities due to its acceptability for the majority of people. Table 7 provides a detailed description of each PLTS rating.

Table 7: Pedestrian Level of Traffic Stress (PLTS) Descriptions

| PLTS <br> Rating | Description of PLTS Segment, Suitability and Condition ${ }^{1}$ |
| :---: | :---: |
| 1 | Represents little to no traffic stress, suitable for all users including children 10 years or younger, groups of people and people using wheeled mobility devices. Provides a separated facility with a buffer between the pedestrian and vehicular traffic. |
| 2 | Represents little traffic stress but requires more attention to the traffic situation than of which young children may be capable. Suitable for children over 10, teens, and adults. Provides sidewalks in good condition; roadways may have higher speeds and volumes |
| 3 | Represents moderate stress and is suitable for adults. An able-bodied adult would feel uncomfortable but safe using this facility. Includes higher speed roadways with smaller or no buffers. Small areas in this facility may be impassable for a person using a wheeled mobility device. Some users are willing to use this facility |
| 4 | Represents high traffic stress. Only able-bodied adults with limited route choices would use this facility. Traffic speeds are moderate to high with narrow or no pedestrian facilities provided. Only the most confident users are willing to use this facility. |

1. Descriptions for PTLS ratings were sourced from the ODOT APM Volume 2.

The PLTS score is based on four criteria, including sidewalk condition, physical buffer type, total buffering width, and general land use. All four criteria are scored from 1-4 and the highest score determines the overall score for the road segment. Figure 13 illustrates the results of the PLTS analysis for the Terrebonne Refinement Plan along improved roadways; gravel and dirt roadways were not analyzed as part of the level of traffic stress analysis.

As shown in the figure, the pedestrian network throughout Terrebonne is largely incomplete. The only sidewalk facilities are present on B Avenue and a segment of US 97 . Nearly all higher order roadways scored a LTS 4 (high stress) with the exception of B Avenue near the Terrebonne Community School, which has a PLTS score of 2, and where sidewalks are complete along US 97, which has a PLTS score of 3. Appendix F provides a detailed summary of the results of the PLTS analysis and includes the scores of each criterion.

## Bicycle Facility Gaps and Deficiencies

Streets with no bike lanes or intermittent bicycle facilities force bicyclists to share the travel lane with motor vehicles, use the shoulder or ride on the sidewalk (if available). In many cases, this is not a desirable option for bicyclists due to the proximity to vehicular traffic. Adequate bicycle facilities should be provided to allow for safe travel between neighborhoods and essential destinations.

The only bicycle facilities in the community include bike lanes on a segment of US 97 between C Avenue and $11^{\text {th }}$ Street. The remainder of the community relies on paved shoulders for bicycles. The Oregon Scenic Bikeway that bisects the community does not have dedicated bicycle facilities.

## Bicycle Level of Traffic Stress

Bicycle facilities located along key roadways were evaluated to identify potential issues that could be addressed as part of the Refinement Plan. The APM provides a methodology for evaluating bicycle facilities called Bicycle Level of Traffic Stress (BLTS). As applied by ODOT, this methodology classifies four levels of traffic stress that a person biking can experience on the roadway, ranging from BLTS 1
(little traffic stress) to BLTS 4 (high traffic stress). A road segment that is rated BLTS 1 generally has low traffic volumes and travel speeds and is suitable for all cyclists, including older children. A road segment that is rated BLTS 4 generally has high traffic volumes and travel speeds and is perceived as unsafe by most adults. The BLTS score is determined based on the vehicular speed, the number of travel lanes per direction, the presence and width of an on-street bicycle facility and/or adjacent parking lane, and several other factors such as the presence of a centerline. Per the APM, BLTS 2 is considered a reasonable target for bicycle facilities due to its acceptability for most adults. Table 8 provides a detailed description of each BLTS rating.

Table 8: Bicycle Level of Traffic Stress (BLTS) Description

| BLTS <br> Rating | Description of BLTS Segment, Suitability and Condition |
| :---: | :--- |
| 1 | Represents little to no traffic stress, suitable for all cyclists. This includes children that are trained to safely cross intersections <br> alone and supervising riding parents of younger children. Traffic speeds and volumes are low. Also includes paths and lanes that <br> are physically separated from motor vehicle traffic. |
| 2 | Represents little traffic stress but requires more attention that young children can handle, so is suitable for teen and adult cyclists <br> with adequate bike handling skills. Traffic speeds and volumes are slightly higher than LTS 1 streets, but speed differentials are still <br> low. |
| 3 | Represents moderate stress and suitable for most observant adult cyclists. Traffic speeds and volumes are moderate. |
| 4 | Represents high stress and suitable for experienced and skilled cyclists. Traffic speeds and volumes are high. |

1. Descriptions for BTLS ratings were sourced from the ODOT APM Volume 2.

Figure 14 illustrates the results of the BLTS analysis for Terrebonne Refinement Plan along improved roadways; gravel and dirt roadways were not analyzed as part of the level of traffic stress analysis. As shown, only a segment of US 97 has dedicated bicycle lanes. The remained of the Community used paved shoulders or shared use facilities. Several roadways scored a BLTS at or below 2. This is largely due to the low vehicular volumes and speeds. Appendix $G$ summarizes the detailed results of the BLTS analysis and includes the scores of each criterion.

Figure 14

## HISTORIC CRASH ANALYSIS

Reported crash data was analyzed at the six key intersections and throughout the study area in effort to identify patterns and trends that may indicate an opportunity to reduce crash frequency and severity. The data was obtained from ODOT for the five-year period from January 1, 2012 through December 31, 2016 and includes information about crash location, type, weather, roadway surface conditions, traffic control, and vehicle information. A summary of reported crashes by study segment is provided in Appendix C.

Figure 15 - Figure 17 provide details on the location and type of crashes recorded during the most recent five-year period. There were no fatal crashes in Terrebonne during the study period.

## Statewide Crash Performance Standards

Table 9 identifies the study intersections that exceed ODOT crash performance. As shown the intersections of US 97/Lower Bridge Way and $11^{\text {th }}$ Street/Smith Rock Way exceed the critical crash rate. Appendices C and E provide additional information and a summary of key observations at study intersections.

Table 9. Summary of Study Intersections that Exceed ODOT Crash Performance Standards

| Intersection | $90^{\text {th }}$ Percentile <br> Crash Rate | Critical Crash <br> Rate | Top 85\% SPIS Site |
| :--- | :---: | :---: | :---: |
| NW 19th Street/Lower Bridge Way | Does not Exceed | Does not Exceed | Does not Exceed |
| US 97/Lower Bridge Way | Does not Exceed | Exceeds | Does not Exceed |
| US 97/C Avenue | Does not Exceed | Does not Exceed | Does not Exceed |
| US 97/B Avenue (Smith Rock Way) | Does not Exceed | Does not Exceed | Does not Exceed |
| 11th Street/Smith Rock Way | Does not Exceed | Exceeds | Does not Exceed |
| US 97/S 11th Street | Does not Exceed | Does not Exceed | Does not Exceed |

Injury Crashes
2012-2016

## SUMMARY OF EXISTING CONDITIONS

The assessment of the existing transportation system conditions and the transportation network inventory identified the following:

- US 97 is a key freight and statewide mobility route that traverse north-south through the Terrebonne Community. The highway also serves as a Tier 1, Phase 1 Lifeline Route considered vital for rescue and recovery operations in case of a natural catastrophe.
- Over Dimensional loads (OD) regularly used US 97 through Terrebonne. These vehicles typically average 120 feet in length, but can exceed 200 feet, including one OD load that was 330 feet.
- The pedestrian network throughout the urban area is largely incomplete. The only sidewalk facilities are present on B Avenue and a short segment of US 97. Nearly all higher order roadways scored a Level of Traffic Stress (LTS) 4 (high stress) with the exception of B Avenue.
- The existing B Avenue marked crosswalk at US 97 could possibly increase the risk of pedestrian related crashes if other pedestrian facility enhancements such as a Rectangular Rapid Flashing Beacon (RRFB) are not installed.
- The only dedicated bicycle facility in the community include bike lanes on a segment of US 97 between C Avenue and $11^{\text {th }}$ Street. The remainder of the community relies on paved shoulders for bicycles. The Oregon Scenic Bikeway that bisects the community east-west does not have dedicated bicycle facilities.
- The following three study intersections did not meet mobility targets for the side-street turning movement:
- US 97/Lower Bridge Way
- US 97/C Avenue
- US 97/B Avenue
- The US 97/Smith Rock Way (B Avenue) intersection meets mobility targets under typical conditions analyzed in this memorandum, though the $95^{\text {th }}$ percentile queue for the westbound approach extends through the $11^{\text {th }}$ Street intersection. Also, this intersection experiences high demand during seasonal events associated with agricultural and recreational amenities to the east.
- Segment volumes indicated that US 97 is currently under capacity through the study area.
- Speed data collected at three segments showed that the $85^{\text {th }}$ percentile speeds on US 97 at Lower Bridge Way and C Avenue exceed the posted speed by 19 and 3 mph , respectively.
- Ninety-three (93) crashes were reported in the greater Terrebonne area during the fiveyear study period. There were no fatal crashes during the study period.
- Of the six study intersections, US 97/Lower Bridge Way and 11 ${ }^{\text {th }}$ Street/Smith Rock Way exceed the ODOT Critical Crash Rate over the past five-year period.

# Appendix E-Statewide Crash Performance Standards Summary 

## 90 ${ }^{\text {th }}$ Percentile Crash Rate Comparisons

A method used to identify intersections with more crashes than expected is to compare the crash rate to the statewide $90^{\text {th }}$ percentile rates for similar intersection types, as documented in Table 4-1 of the ODOT APM. The daily total entering vehicles used to determine the crash rate was based on the peak hour intersection turning movement counts. The peak hour was assumed to be ten percent of the daily volume. A table of all the study intersection crash rates compared to the statewide $90^{\text {th }}$ percentile rates for similar facilities is shown below. None of the study intersections exceed the statewide $90^{\text {th }}$ percentile crash rates.

Study Intersections that Exceed $90^{\text {th }}$ Percentile Crash Rate

| Intersection | Intersection Control <br> Type | Statewide 90th <br> Perc. Crash Rate | Intersection <br> Crash Rate |
| :--- | :--- | :--- | :--- |
| NW 19th Street/Lower Bridge Way | 3-way stop controlled | 0.48 | 0.00 |
| US 97/Lower Bridge Way | 4-way stop controlled | 1.08 | 0.37 |
| US 97/C Avenue | 4-way stop controlled | 1.08 | 0.05 |
| US 97/B Avenue (Smith Rock Way) | 4-way stop controlled | 1.08 | 0.33 |
| 11th Street/Smith Rock Way | 4-way stop controlled | 1.08 | 0.71 |
| US 97/S 11th Street | 3-way stop controlled | 0.48 | 0.05 |

## Critical Crash Rate Comparisons

A critical crash rate may be used to identify intersections that warrant further investigation and may represent opportunities to reduce crash frequency and severity. The critical crash rate establishes a threshold for comparison among intersections with similar number of approaches and similar traffic control. The study intersections exceeding the critical crash rate are identified in the table below.

Study Intersections that Exceed the Critical Crash Rate

| Intersection | Critical Crash Rate | Observed <br> Crash Rate |
| :--- | :---: | :---: |
| NW 19th Street/Lower Bridge Way | 0.36 | 0.00 |
| US 97/Lower Bridge Way | 0.33 | 0.37 |
| US 97/C Avenue | 0.33 | 0.05 |
| US 97/B Avenue (Smith Rock Way) | 0.33 | 0.33 |
| 11th Street/Smith Rock Way | 0.51 | 0.71 |
| US 97/S 11th Street | 0.24 | 0.05 |

## Statewide Safety Priority Index System

The ODOT Statewide Safety Priority Index System (SPIS) identifies sites along state highways where safety issues warrant further investigation. The SPIS is a method developed by ODOT for identifying hazardous locations on state highways through consideration of crash frequency, crash rate, and crash severity. The sites are listed under the 2016 SPIS based on 2013 through 2015 crash data. No intersections above the $85 \%$ percentile were identified in Terrebonne.

## Summary of Key Intersections and Crash Types

The critical crash rate was the only statewide standard exceeded at the study intersections during the study period. The following is a summary of the intersections that exceeded the critical crash rate.

- US 97/Lower Bridge Way
- A total of 14 reported crashes during the study period, 8 of which resulted in injury.
- Weather and lighting did not appear to be a contributing crash trend.
- One crash resulted in serious injuries. A total of five persons were injured in the crash including a child under the age of 4 .
- There were 6 turning movement, 5 rear-end, 2 sideswipe, and 1 miscellaneous crash at the intersection. No notable crash trends were identified.
- $\mathbf{1 1}^{\text {th }}$ Street/Smith Rock Way
- Six crashes were reported at this intersection. Half of the crashes resulted in injury.
- Five of the crashes were angle crashes and once crash involved a pedestrian.
- Pedestrian Crash
- A pedestrian crash at $11^{\text {th }}$ Street/Smith Rock Way during night time conditions. The crash report indicated that the non-motorist was illegally in the roadway and wearing dark clothing at the time of the crash. The crash resulted in moderate injuries.
- Heavy Vehicle Crashes
- Three crashes involving heavy vehicles occurred during the study period.
- April 9, 2014: A fixed object crash occurred at the intersection of F Avenue $/ 13^{\text {th }}$ Street. The daytime crash resulted in property damage only.
- October 1, 2016: A turning movement crashes occurred at Smith Rock Way/Cornelius Road. The crash involved a farm tractor and resulted in property damage only.
- June 18, 2016: A rear end collision occurred on US 97 slightly north of Odem Avenue. The tractor trailer jackknifed due to insufficient brakes. The crash resulted in minor injuries.

> Appendix F Pedestrian Level of Traffic Stress
