Section 5 – 2035 Preferred Alternative

Preferred Transportation System Analysis - Tech Memo 12.4

This analysis looked at the County Transportation with the addition of the recommended transportation capital improvements that are included in the 20 Year Capital Projects list (Tier 1 Projects). This analysis was based used the 2035 Gamma Forecast of households and employment as the estimate of future growth and the volume to traffic operations standards required under the provisions of the Oregon Highway Plan and Metro Regional Transportation Functional Plan.

Five of the intersections analyzed during this process were determined NOT to meet the traffic operations standards. It will be necessary to develop alternate performance standards for these intersections under the requirement of the Oregon Highway Plan Policy 1.F.

ID	Intersection	Performance Standard	Tier 1 Project?	Meets Standard in Tier 1 Scenario?
124	SE Harmony Rd/SE Linwood Ave	v/c = 0.99	U103 (Grade-sep RR crossing)	No (v/c=1.41)
141	OR 224/SE Lake Rd/SE Webster Rd – ***ODOT Intersection***	v/c = 0.99	2118 (second WBL turn lane)	No (v/c=1.30)
161	OR 212/SE 172nd Ave– ***ODOT Intersection***	v/c = 0.99	U019 (Sunrise imp)	No (v/c=1.03)
406	S. Henrici Rd/OR 213– ***ODOT Intersection***	V/C = 0.75	2109 (traffic signal or roundabout)	No (v/c=0.84)
501	OR 212/SE 282nd Ave– ***ODOT Intersection***	v/c = 0.70		No (v/c=1.07)

Methodology for Identifying Gaps in the Arterial and Collector System

The County Arterial and Collector Road System has been evaluated for gaps in the system and updates to the system were recommended. Ultimately all of these recommendations were determined to be unfeasible due to topographic or environmental considerations.

Functional Class Changes

The County Road Functional designations have been evaluated and updated during the course of the TSP Update Process.

The Federal functional class designations and the National Highway System designation were update in late 2012 as part of the implementation of the MAP 21 program.

CLACKAMAS COUNTY TRANSPORTATION SYSTEM PLAN Update

Tech Memo 12.4: Tier 1 Scenario Analysis

Date: August 12, 2013

Project #: 11732

To: Transportation System Plan (TSP) Technical Advisory Committee (TAC) Members and Public Advisory Committee (PAC) Members

From: TSP Project Management Team

Project: Clackamas County Transportation System Plan Update

Subject: Analysis of draft 20-Year Capital Projects (Tier 1) Network

This memorandum summarizes the operational analysis performed on the draft 20-Year Capital Projects (Tier 1) network, hereafter referred to as the *Tier 1 Scenario*. The intent of this analysis is to identify any necessary changes to the 20-Year Capital Projects list or adjustments in project priorities to best meet the TSP goals and objectives.

I. BACKGROUND

At this stage of the TSP update, the project lists for the Clackamas County Transportation System Plan (TSP) are being finalized according to the goals, priorities and available funding. This process will result in three project lists, shown in Table 1, which will define the County's transportation priorities for the next 20 years.

Table 1 TSP Project List Organization

Project List Name	Tier	Previous Name	Funding Available	Type of Projects Included
20-Year Capital Projects	1	Fiscally Constrained List	Approximately $444 million (based on funding forecast)	Top recommended projects that can reasonably be undertaken given the current estimates of available funding.
Preferred Capital Projects	2	Preferred Project List	Approximately $444 million (potential additional funding)	Additional recommended projects that the County hopes to undertake if additional funding becomes available during the next 20 years.
Long-Term Capital Project Needs	3	Vision Project List	None known	All other needed projects identified in the TSP update process. These are not expected to be funded or constructed by the County during the next 20 years, but they are still needed to meet the County's projected transportation needs.

The current draft project lists were developed based on a variety of information and input, including:

- An analysis of the transportation system and study intersections under existing conditions, the 2035 Low Build Scenario (includes funded projects as of summer 2012), and the 2035 Full Build Scenario (includes all planned projects in the previous TSP).
- A goal assessment of potential projects based on the vision, goals, and objectives of the TSP.

- Public input gathered via the Public Advisory Committee (PAC), three virtual workshops, and community outreach activities.
- Feedback from Geographic Area Priority (GAPS) groups, a Technical Advisory Committee (TAC), and County staff.

The current draft 20-Year Capital Projects (Tier 1) List reflects the recommended priorities coming out of PAC meeting #5C, held April 30, 2013. Maps and tables of the projects are available in *Appendix A*.

II. TIER 1 SCENARIO

In order to further inform the prioritization process, an operational analysis was performed to assess how the transportation system operates with the projects currently on the draft 20-Year Capital Projects List (Tier 1 Scenario). The projects included in this analysis are listed and mapped in *Appendix A*. The intent of this analysis was to identify the following:

- Tier 1 Projects that need to be adjusted (project extents, description, and/or cost) in order to best address an identified deficiency,
- Tier 2 or 3 Projects that need to be elevated in priority to address an identified deficiency,
- Tier 1 Capacity Projects that do not address a projected deficiency and therefore may not be needed in the 20-year horizon, and
- Any remaining deficiencies in the transportation system not addressed by a project on the TSP list.

A. Volume Development

The operational analysis relied on the development of link volumes and turning movement count volumes at key study intersections. As with the 2035 Low Build Scenario and 2035 Full Build Scenario assessed in earlier TSP efforts, this analysis assumed 2035 projected population and employment growth. Metro's recently released Joan Version 2 model was utilized to develop volumes, whereas earlier modeling efforts used the Joan Version 1 model. The key differences between these models are summarized in the materials provided in *Appendix B*. Based on discussions with Metro Travel Modeling staff, the differences between the two models are likely the result of the following:

1. Changes in the 2035 Land Use Assumptions – Households and Employment

The Joan Version 2 model uses the 2035 Gamma forecast, whereas the Joan Version 1 model used the 2035 Beta forecast. The Gamma Forecast has approximately 8,000 fewer households overall, fewer households in the County, and a general decrease in household incomes (which is strongly associated with reduced access to automobiles and increased demand for transits service). The vehicle trip reduction is slightly larger when analyzing the 2-hour PM peak because more transit trips are generated. As a result of these changes in the 2035 land use and economic assumptions, the total

number of vehicles trips in 2035 decreased by 13% between the Beta Forecast and the Gamma Forecast.

2. Changes to the Travel Model

A key component of a travel model is the origin-destination (O-D) matrix, which allocates all of the trips generated in a traffic analysis zone (TAZ) to the other TAZs in the regional travel model. The travel survey used in the previous Metro model was conducted in 1994 and showed that 93.2% of all trips in the County were made by automobile. The updated Metro model utilized a new travel survey from 2011 which showed that 87.6% of trips in the County were made by automobile. Therefore, the change to the new travel survey data resulted in an additional 5% reduction in the overall number of trips made by automobile in 2035.

The combined effect of these two changes to the travel model is an 18% reduction in number trips made by automobiles and a resulting decrease in the travel volumes shown by the Joan Version 2 model in 2035. These changes are reflected in the link volumes and turning movement counts utilized in the Tier 1 Scenario analysis, as discussed further later in this memo.

B. Study Intersections

Fifty intersections were selected for analysis under the Tier 1 Scenario (of the 125 intersections studied in the *Existing and Future Conditions Report*). Intersections were selected based on several factors, including:

- Intersections that were not projected to meet standards under the 2035 Low Build
- Intersections that were impacted by a Low Build project not included in the Tier 1 Scenario (i.e. in the vicinity of the Sunnybrook Extension)

The lane configurations and traffic control devices at the study intersections assumed for the Tier 1 Scenario are shown in *Appendix C.*

III. KEY FINDINGS

The operational analysis assessed operations at both the study intersections and roadway segments in the County. The key findings from both analyses are detailed below.

A. Intersection Operations

The intersection operations under the Tier 1 Scenario are shown in the figures in *Appendix D* and summarized in Table 2.

Table 2 Tier 1 Scenario Study Intersection Operations

ID	Intersection	Jurisdiction	Performance Standard	Low Build Project?	Meets Standard in 2035 Low Build?	Tier 1 Project?	Meets Standard in Tier 1 Scenario?
104	SE Johnson Creek Blvd/89th Ave	County	v/c = 1.1	No	No	2114	Yes

503	OR 224/OR 211	ODOT	v/c = 0.80	No	No	U427	Yes

As shown in the figures and table above, forty-five of the study intersections meet standards under the Tier 1 Scenario. The majority of these intersections are directly impacted by a Tier 1 project, i.e. the addition of turn lanes or a change in traffic control. Others experience a change in projected volumes (either due to nearby improvements or model changes, as discussed above) that cause them to operate within standards. Five of the intersections do not meet standards under the Tier 1 Scenario. None of these intersections meet standards under the 2035 Low Build. Four of these are impacted by a Tier 1 project, but still fall short of standards.

B. Roadway Segment Analysis

The roadway segment volumes provide a sense of the demand for travel on roadways. Figures are provided in *Appendix E* illustrating the roadway link volumes from the weekday evening peak hour for the Tier 1 Scenario. Overall, the figures reflect a reduction in link volumes during the weekday PM peak hour, compared to the 2035 Low Build and 2035 Full Build scenarios. This reflects the changes in the model described above, including a reduction in projected household growth and automobile travel. The model used to develop the volumes makes its forecast for the PM peak hour, which has a higher

percentage of total trips occurring by transit (compared to total daily trips). This could also contribute to the overall reduction in link volumes.

The level of congestion experienced on roadway segments was estimated using the roadway segment volumes from the Metro base model and the roadway segment capacity. The volume was compared to the capacity to calculate a volume-to-capacity ratio that is used to estimate the level of congestion. Figures are provided in *Appendix E* illustrating the relative congestion during the Tier 1 Scenario weekday evening peak hour on roadways based on the estimated roadway segment volumes and capacity. The figures reflect an overall reduction in congestion compared to the Low Build Scenario (particularly on I-205, OR 213, OR 212, OR 43, Carver Bridge and SE Sunnyside Rd). The Tier 1 Scenario segment congestion analysis shows only a few isolated points of congestion, including several roadways within Oregon City, on Arndt Rd, portions of I-205, and a couple of roadway segments within Damascus.

IV. RECOMMENDATIONS

The intersections that do not meet standards under the Tier 1 Scenario were further assessed to determine what changes to the TSP project lists are needed to address these deficiencies. The draft Tier 2 (Preferred Capital Projects) and Tier 3 (Long-Term Capital Project Needs) lists were reviewed to assess whether there are any capacity projects on these lists that would address the intersection deficiencies. The results of this assessment are shown in Table 3.

Table 3 Intersections that do not meet Standards under the Tier 1 Scenario

ID	Intersection	Performance Standard	Tier 1 Project?	Meets Standard in Tier 1 Scenario?	Tier 2 or Tier 3 Project?	Meets Standard with Tier 2 or Tier 3 Project?
124	SE Harmony Rd/SE Linwood Ave	v/c = 0.99	U103 (Grade-sep RR crossing)	No (v/c=1.41)	No	No (needs additional improvements)
141	OR 224/SE Lake Rd/SE Webster Rd – ODOT Intersection	v/c = 0.99	2118 (second WBL turn lane)	No (v/c=1.30)	No	No (needs additional NBL and SBL turn lanes, NBR turn lane)
161	OR 212/SE 172nd Ave– ODOT Intersection	v/c = 0.99	U019 (Sunrise imp)	No (v/c=1.03)	2122 (Second EBL turn lane) - Medium	Yes
406	S. Henrici Rd/OR 213– ODOT Intersection	V/C = 0.75	2109 (traffic signal or roundabout)	No (v/c=0.84)	No	No (needs additional through lane on OR 213)
501	OR 212/SE 282nd Ave– ODOT Intersection	v/c = 0.70		No (v/c=1.07)	2105 (Second SBR turn lane) – Tier 3	No (needs second EBL, additional through lane on OR 212)

Each of the intersections is discussed in more detail below:

1. SE Harmony Rd/SE Linwood Ave (124)

Project U103 creates a grade-separated railroad crossing at the intersection of SE Harmony Rd/SE Linwood Ave. With this improvement, the intersection is projected to operate at a v/c ratio of 1.41, which is well over standards. The projected volumes show a large number of vehicles traveling between the south leg (SE Harmony Rd) and east leg of the intersection (SE Harmony Rd). **The project team recommends modifying the description of project U103 to include appropriate intersection improvements at SE Harmony Rd/SE Linwood Ave.** Further study is needed to determine the appropriate intersection improvements. Potential treatments include additional turn-lanes or a reconfiguration of the intersection to two T-intersections (so that SE Railroad Ave and SE Linwood Ave converge before intersecting with SE Harmony Rd).

2. OR 224/SE Lake Rd/SE Webster Rd (141) – ODOT Intersection

Project 2118 adds a second left-turn lane on westbound OR 224 at SE Lake Rd/SE Webster Rd. With this improvement, the intersection is projected to operate at a v/c ratio of 1.30, well over the standard of 0.99. **The project team recommends modifying the description of project 2118 to include additional intersection improvements,** including a second left-turn lane and right-turn lane on northbound SE Webster Rd and a second left-turn lane on southbound SE Lake Rd.

3. OR 212/SE 172nd Ave (161) – ODOT Intersection

The intersection of OR 212/SE 172nd Ave operates just over the v/c ratio standard of 0.99. Project 2122, which adds a second eastbound left-turn lane on OR 212, is currently ranked as medium priority on the ODOT project list. This project would improve operations at the intersection to bring it within standards. **Therefore, the project team recommends moving project 2122 from medium to high priority.**

4. S. Henrici Rd/OR 213 (406) – ODOT Intersection

Project 2109 changes the traffic control at S. Henrici Rd/OR 213 to a signal or roundabout. With either improvement, the intersection operates over-capacity, largely due to the heavy volumes of northbound and southbound vehicles. As a signal, the intersection operates at a level-of-service (LOS) B, a delay of 10.1 seconds, and with a v/c ratio of 0.84. Therefore, while the intersection operates well in terms of the LOS and delay, it does not meet the v/c ratio standard of 0.75. **Therefore, the project team recommends either adjusting the performance standard at this intersection or modifying the description of project 2109 to include additional intersection improvements**, such as auxiliary northbound and southbound through lanes.

5. OR 212/SE 282nd Ave (501) – ODOT Intersection

The intersection of OR 212/SE 282nd Ave operates at a v/c ratio of 1.07, above the standard of 0.70. Project 2105, which is currently in Tier 3, adds a second right-turn lane on southbound 282nd Avenue. With this project, the intersection still operates well above the v/c standard of 0.70, largely due to the heavy volume of vehicles on OR 212 using a single through lane. **Therefore, the project team recommends either adjusting the performance standard at this intersection or modifying the description of project 2105 to include additional intersection improvements**, such as auxiliary eastbound and westbound through lanes and an additional eastbound left-turn lane.

Recommendations to Address Roadway Congestion

The roadways that are projected to be congested were also further assessed to identify what changes are needed to the TSP project list to address these deficiencies. The most significant areas of congestion are discussed below.

1. OR 212

Within the Clackamas Regional Center/ Industrial Area, a portion of OR 212 near 172nd Ave is projected to be very congested. Project 2122, which adds a second eastbound left-turn lane at the OR 212/172nd Avenue intersection, is currently medium priority. As part of the intersection analysis (see discussion above), the project team recommends moving the project from medium to high priority to address deficient operations at the intersection of OR 212/SE 172nd Ave. This project would also likely ease congestion on OR 212.

2. Springwater Rd

The portion of Springwater Road near OR 224 within the Clackamas Regional Center/Industrial Area is projected to be very congested. In order to address this deficiency, **the project team recommends adjusting the description of project U184 (currently Tier 1) to widen Springwater Rd to 3 lanes with shoulders and pedways between OR 224 and Hattan Rd**. Based on the intersection operations at OR 224/ Springwater Rd, it is recommended to keep the bridge at 2 lanes.

3. Arndt Rd

The portion of Arndt Rd between OR 551 and Barlow Rd just east of I-5 in the Southwest County is projected to be very congested. Based on current development restrictions, Arndt Rd cannot be widened. Further study is necessary to determine a solution to the congestion projected for this area. **Therefore, the project team recommends a study to identify and consider roadway improvements to address access to I-5 within the Southwest County and address capacity deficiencies.**

Additional Recommendations

Several of the intersections in the vicinity of the Clackamas Town Center (i.e. SE Harmony Rd/SE Fuller Rd, SE Sunnyside Rd/SE Harmony Rd/SE 82nd Ave (OR 213), and SE Sunnyside Rd/I-205 SB Ramps) operate just within volume to capacity (v/c) standards. While improvements were considered for the regional center in earlier stages of the TSP Update process (i.e. the Sunnybrook Extension and Harmony widening), they were removed from the project lists based on feedback from the PAC, TAC, and public. It is unlikely these intersections can support much additional growth in the Town Center beyond what is included in the model forecasts. New development under current regulations will become increasingly challenging. Thus, it is recommended that the County consider modifying the current v/c ratio standard and developing alternative performance standards for the regional center (as previously recommended in the *Dynamic Traffic Assignment* Memo). In order to accomplish this, **the project team recommends a study to develop alternative performance standards for the intersections within the Clackamas Regional Center.**

V. NEXT STEPS

The results of the Tier 1 Scenario operational analysis and key findings were reviewed by the TAC during TAC Meeting #8 on July 18th, 2013. The TAC discussed changes that should be made to the 20-Year Capital Projects and adjustments in project priorities that should be made as a result of the findings. In addition, the TAC considered the feedback gathered during public outreach activities from this spring, including presentations at community and business meetings, and an online "virtual" open house. The TAC and PMT developed a set of recommendations and draft 20-Year Capital Projects list, referred to as the "Draft Recommendation to the Planning Commission."

The PAC will discuss the projects, programs, and policies in the Draft Recommendations to the Planning Commission during PAC Meeting #6 on August 20th. Discussion will focus on recommendations that have changed based on public comment, the Tier 1 Scenario Analysis, and/or TAC input. The PAC will have an opportunity to discuss the changes made and come to consensus on final TSP recommendations to be sent to the Planning Commission. Public review of the final plan will occur October through December when it will be presented to the Planning Commission and Board of County Commissioners, respectively.

Recent Changes to the Regional Travel Demand Model

Recent changes to Metro's Regional Travel Demand Model have resulted in forecast travel volumes in Clackamas County in 2035 that are ***less than previous forecast travel volumes***. These revised forecasts, and the adoption of new performance standards, mean that the levels of projected congestion on Clackamas County roads and the number of Clackamas County intersections projected to fail in the next 20 years has ***decreased***.

This memo reviews what the changes are and the impact they have had on the travel demand forecast.

Clackamas County is updating its Transportation System Plan (Comprehensive Plan Chapter 5). As part of this work Clackamas County conducted extensive analysis of the arterial and collector road system in the County using information from Metro's Regional Travel Demand Model and other transportation data sources.

During this multi-year TSP update process, Metro's Regional Travel Demand Model has been updated and revised, resulting in changes in forecast traffic volumes on the regional arterial and collector road system.

The major changes are listed below, followed by more detailed descriptions of each.

A. Changes in land use assumptions, which result in changes to forecast vehicle trips
    a. Distribution and number of households
    b. Distribution and amount of employment
    c. Economic composition of households
B. More detailed analysis of travel, based on increased Travel Analysis Zones (TAZs),
C. Changes in travel model trip assignments
D. Changes in total amount of employment in Clackamas County

There are three levels of modeling that have been applied during this process:

1. **Beta Forecast**: Used in winter and spring 2012 for existing and future conditions modeling for 2010 and 2035 low-build and full-build scenarios with 2-hour PM peak forecasts
2. **Gamma Forecast/2-hour PM peak**: Used in summer 2013 for Tier 1 scenario modeling for 2035 (including the projects on the draft 20-Year Capital Project List) with 2-hour PM peak forecast
3. **Gamma Forecast/1-hour PM peak:** Will be used for the next round of RTP updates in 2014with 1-hour PM peak forecast and a peak spreading algorithm

The County conducted its first round of analysis using the 2010 and 2035 Beta forecasts. This analysis identified that 44 intersections out of the 125 studied would fail to meet performance standards in 2035. When the Tier 1 Scenario was analyzed using the Gamma forecast, only five intersections were identified as failing to meet the performance standards in 2035.

Clackamas County Transportation staff and Metro Travel Modeling staff have identified the following changes between the travel models.

A. Changes in 2035 Land Use Assumptions – Households and Employment

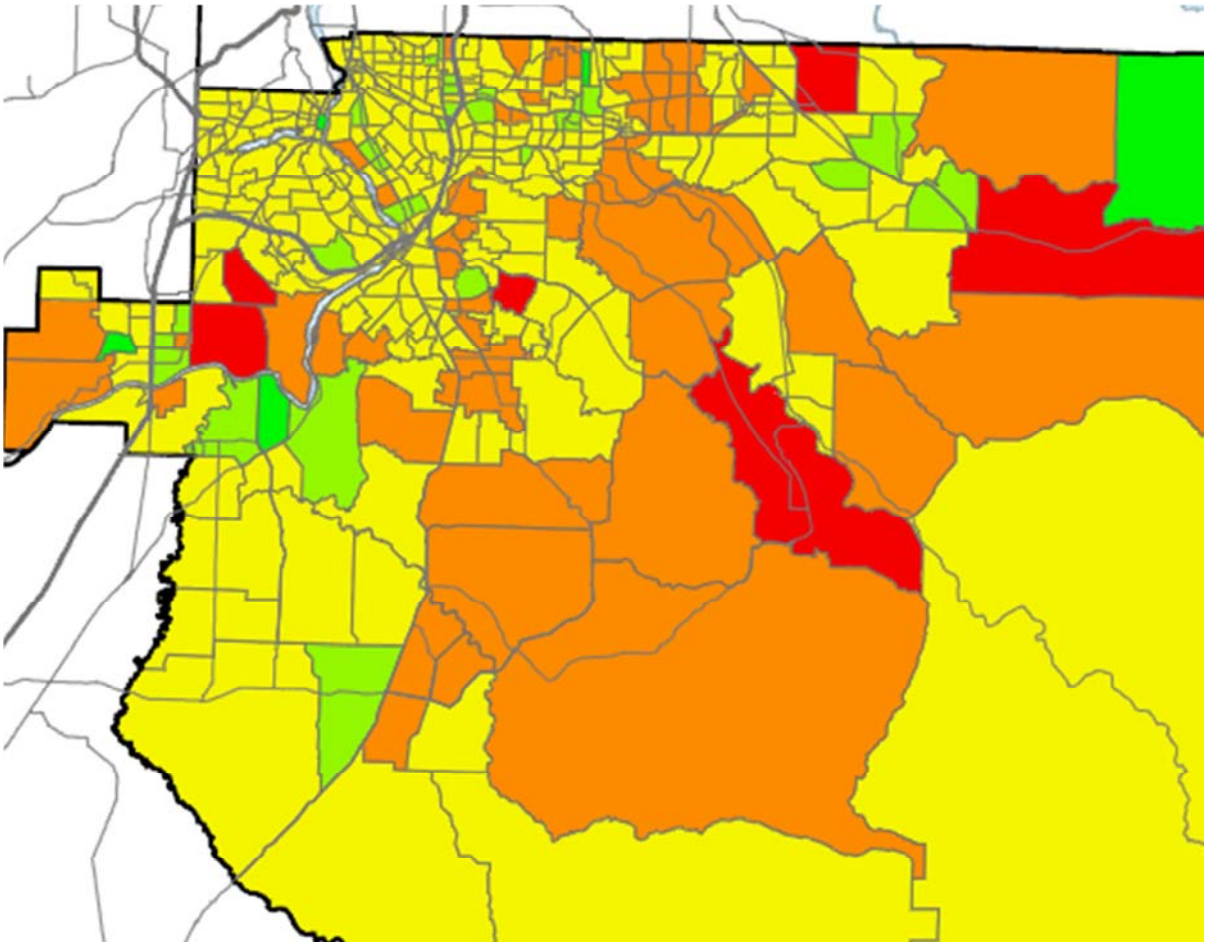
- The 2035 Gamma forecast has approximately 8,000 fewer households in Clackamas County than the 2035 Beta forecast. The final Transportation Analysis Zone (TAZ) allocations used in Metro's travel demand modeling tools for the two model runs being compared are shown below.

Total Households	2035 Beta	2035 Gamma	# Diff	% Diff
4-County* Total	1,197,568	1,168,967	-28,601	-2.4%
Clackamas County	***216,602***	***208,433***	***-8,169***	***-3.8%***

Total Employment	2035 Beta	2035 Gamma	# Diff	% Diff
4-County* Total	1,439,285	1,412,606	-26,679	-1.9%
Clackamas County	***205,960***	***210,444***	***+4,484***	***+2.2%***

The four counties are Clackamas, Clark, Multnomah and Washington.

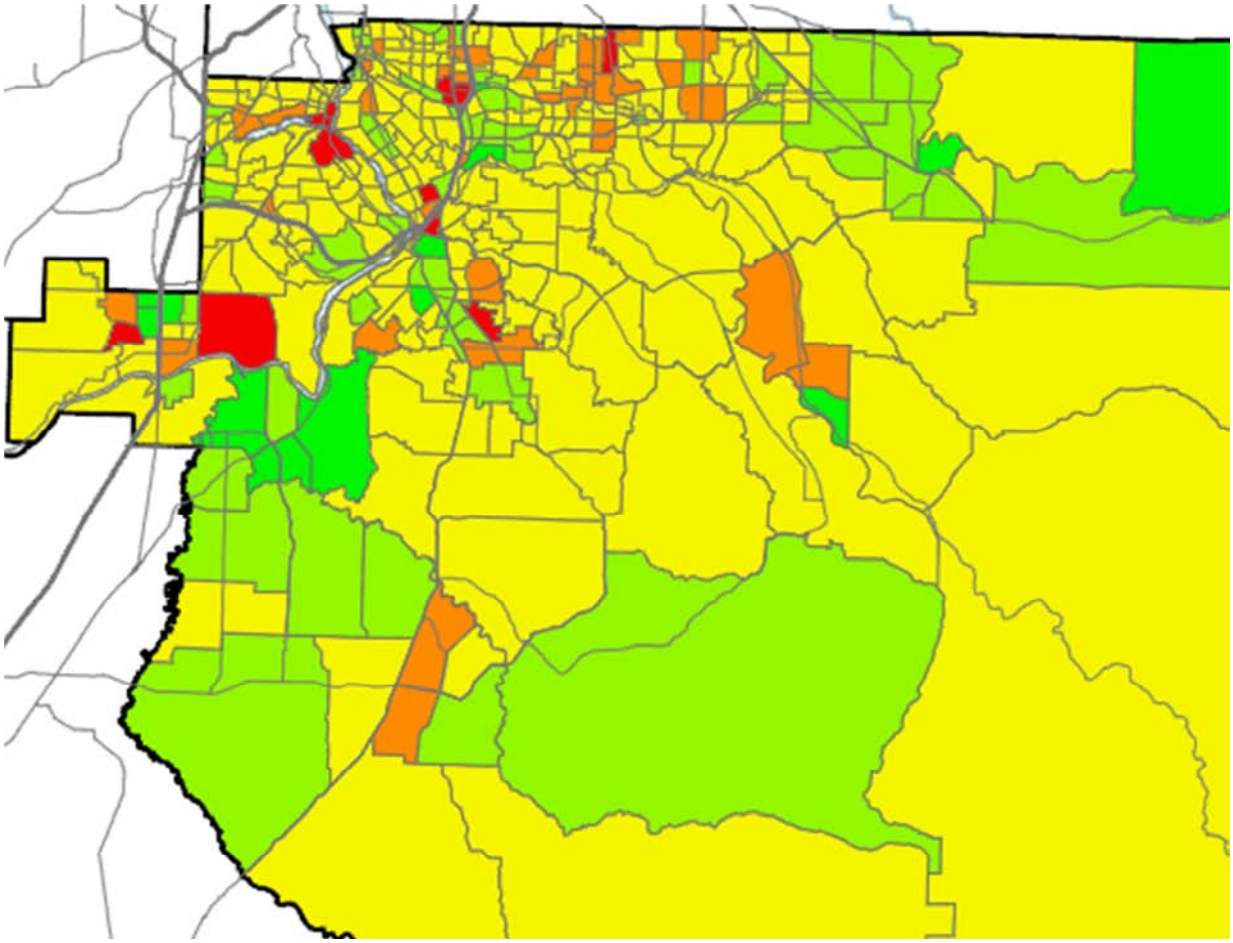
Households were redistributed within Clackamas County as shown in the map below. Red and orange indicate zones with fewer households in the Gamma forecast; green shows which zones had gains in the total number of households.



The different distribution of households results in local variations in the number of trips generated. This distribution can be described in the following terms:

- The Damascus and Estacada areas have fewer households.
- The Canby, Molalla and Sandy areas have more households.

Employment was also redistributed and increased slightly. Again, the red and orange indicate zones with less employment in the Gamma forecast while green shows the zones with gains.



There is a countywide change in the economic composition of the households between the two models, which affects the number of trips generated in the County.

- There is a general decrease in household income levels across the County, which may be related to large numbers of households with residents who are or soon will be retiring. Lower household incomes are strongly associated with reduced access to automobiles and increased demand for transit services.
- The make-up of the households in Clackamas County was changed as a result of the 2010 Census. Between the Beta and Gamma allocations, the shares of larger and higher income households were reduced somewhat, and the shares of smaller and lower income households were increased. The

percentage changes may not be large, but they are definitely contributing factors. In Metro's model, lower income households make fewer trips, own fewer cars, and are more sensitive to travel costs than higher income households.

Below are the daily trips generated by households in the travel demand model given the land use allocations:

Total Trips Produced	**2035 Beta**	**2035 Gamma**	**# Diff**	**% Diff**
4-County Total	12,330,500	11,425,400	-905,100	-7.3%
Clackamas County	***2,302,700***	***2,076,300***	***-226,400***	***-9.8%***

Total Work Trips Produced	**2035 Beta**	**2035 Gamma**	**# Diff**	**% Diff**
4-County Total	2,143,300	1,978,700	-164,600	-7.7%
Clackamas County	***426,500***	***380,300***	***-46,200***	***-10.8%***

- As a result of these changes in the 2035 land use and economic assumptions, **the total number of vehicles trips in 2035 decreased by 10%** between the Beta forecast and the Gamma forecast.

B. Changes to the Travel Model

A key component of a travel model is the Origin-Destination (O-D) Matrix which allocates all of the trips generated in a Traffic Analysis Zone (TAZ) to all of the other TAZs in the Regional Travel Model. This allocation is based on the results of a detailed travel survey of a large number of people living in the region.

- There are currently 2,162 TAZs in the Travel Demand Model.
- The old travel survey conducted in 1994 showed that 93% of all trips in Clackamas County were made by automobile. This survey data was used by the Beta model in the initial phase of the TSP update travel analysis.
- The new travel survey conducted in 2011 showed that 87.6% of all trips in the region were made by automobile. This survey data was used by the Gamma model in the Preferred Alternative travel analysis.

The following table shows how mode shares changed between 1994 and 2011 for all households.:

Mode Share by Area of Residence, 1994 vs. 2011 (source: *Metro Household Travel Survey*)

	1994	2011	1994	2011
	Region	**Region**	**Clackamas**	**Clackamas**
Single-Occupancy Vehicle (SOV)	43.4%	42.5%	46.2%	45.1%
High-Occupancy Vehicle (HOV)	43.9%	41.2%	47.0%	42.5%
Total Auto	*87.3%*	*83.8%*	*93.2%*	*87.6%*
Transit	2.9%	4.2%	1.1%	2.9%
Walk	8.7%	9.2%	5.2%	8.2%
Bike	1.1%	2.8%	0.4%	1.3%

- The survey shows that Clackamas County continues to have a higher proportion of auto trips than the 4-county region as a whole (93.2% vs. 87.3% and 87.6% vs. 83.8%). However, there were significant increases in non-auto modes between 1994 and 2011 which resulted in **an additional 5% reduction in the overall number of trips made by automobile in 2035.**
- The combined effect of these two changes to the travel model is a 15% reduction in the number of trips made by automobiles and a resulting decrease in the travel volumes shown by the model in 2035.
- The above analysis indicates that there are a number of factors contributing to the reduction of trips region-wide and in Clackamas County – fewer households, change in household composition and recalibrated mode shares. While these may not be the entire story, they explain a large amount of the differences in projected 2035 traffic volumes.

Additional Travel Model Issues

C. Travel Model Trip Assignments

- The 15% decrease in trips is based on the total daily trips.
- The model makes its forecast for the PM peak hour, which has a higher percentage of the total trips occurring by transit.
- The result of this difference is an additional reduction in auto trips of approximately 3%, which increases the total reduction of in automobile PM peak hour trips to 18%.

D. Employment Changes

- The total employment in Clackamas County increased by a few thousand jobs between the Beta forecast and the Gamma forecast.
- The change may produce shorter journey-to-work trips as people in Clackamas County households have more opportunities to be employed within the county.

The combined effect of these four factors is estimated to reduce the number of automobile trips by at least 18% from the model estimate developed as part of the TSP low-build model in the *Existing and Future Conditions Analysis*.

Model Trip Reduction and New Traffic Operations Performance Standards

- The Oregon Highway Plan (OHP) and the Regional Transportation Functional Plan (RTFP) require that the County adopt new traffic operation performance standards using a volume-to-capacity (v/c) measure.
- The combination of new performance standards and reduced travel volumes estimated by the travel model will substantially reduce the number of intersections that fail to meet the performance standards.
- **The effect of these changes is not going to solve future traffic capacity problems, but will potentially push out the time at which the problems / failures are projected to occur beyond the 20-year planning horizon.**

APPENDIX 1: Summary of Network and Model Enhancements since the last RTP Update

prepared by Metro staff, July 2013

Network Updates

- The Transportation Analysis Zone (TAZ) system was significantly modified (from 2,013 to 2,162 TAZs). The new zones are better aligned with current tax lot boundaries.
- The base year was updated from 2005 to 2010.

Updated Inputs

- 2040 design types updated to include more tiers based on findings from State of the Centers report and Transit-Oriented Development strategic plan reflecting that not all Centers and Station communities are in the same stage of development.
    - Regional Centers – from 1 to 2 tiers
    - State Communities – from 1 to 3 tiers
    - Town Centers – from 2 to 4 tiers
    - Corridors – NW 23rd adjusted to reflect high parking restrictions compared to other Corridors.
- Updated TAZ assumptions based on 2040 design types to allow for more control over policies being tested. Main Street, Corridor, Inner neighborhood all used to be in one classification. By splitting them, you can test parking policy on just corridors.
    - Parking factors – coordinated with City of Portland to reach agreement. Central City parking costs have been increasing at different rates in different parts of the city. Agreement reached to use a consistent value in the future.
    - Intersection densities recalculated to reflect new zone system
    - Transit pass factors updated to 2010$

Model Enhancements

- The last RTP update used the Ivan model.
- The East Metro Connections Plan used Joan model (version 1.0)
- The 2014 RTP update will use the Joan model (version 2.0), which was used by other planning efforts such as the SW Corridor Plan, Active Transportation Plan, and several recent TSPs.
    - Enhancements included in Joan Version 2.0 include:
        - Transit time perception
            - Wait time perception varies depending on stop type: pole, basic shelter, enhanced shelter/transit center
            - In-vehicle time perception varies depending on vehicle types: bus, street car, light rail
        - Park & Ride Lot Choice
            - A traveler considering using the park-ride mode is now given the opportunity to consider multiple lots locations. Prior, only one lot choice was offered.
        - Validation to the Portland/Vancouver Region Travel Behavior Survey

- The model was modified as necessary to make sure that parameters were effective in producing model results that reflected today's conditions. New regional mode shares will be reflected in new model to reflect change from 1997 to 2011 surveys: decrease in auto (87.3 to 83.7), increase in biking, walking and transit (12.7 to 16.2) (these numbers include travel to/from Clark County.

- Bike model
  - Formerly the regional model only factored trip distance into the decision to bike as well as some socioeconomic/demographic factors. The new model calculates a travel utility between zone pairs, and includes all streets. Bike lanes, boulevards, trails, etc. are flagged as more attractive than other routes. Consideration is given to the volume of auto traffic, number of stop signs/signals along route, number of left turns, slope, other network attributes.
  - The bike model assigns bike trips to the network, illustrating volume flows, identifies origins and destinations of users traveling along a given segment of the network, calculates bike miles traveled.
  - The tool is unique compared to most other regions because the bike mode competes with the other modes with regard to the attractiveness to the traveler. As the utility rises and the bike mode becomes more attractive, trips on other modes switch to bikes based upon the degree of change in the attractiveness.
- Peak-spreading algorithm
  - The treatment in the peak hour has been updated to better match count and survey data, providing a more realistic treatment of how travelers response to the peak period congestion
  - Captures the shoulder hour impacts as excess demand in peak periods is moved to adjacent hours
  - Permits inspections of performance on an hourly basis, e.g. 4:00-5:00, 5:00-6;00, 6:00-7:00
  - The algorithm does not impact the base year (2010) significantly. It is much more important in the future years in routes where demand far exceeds network capacity in the peak hours (volume / capacity > 1.0).
  - The algorithm uses today's 'most congested' corridors as a proxy for a future year congestion threshold. Future year demand is spread when congestion along corridors exceeds this threshold.
- Costs updated from 1994 dollars to 2010 dollars
- Airport demand model has been implemented
- Truck flows updated to reflect most recent land use forecast (Gamma)

Methodology for Identifying Projects to Comply with the RTFP

The following describes two analyses performed to identify transportation projects that may be necessary to include in the Clackamas County TSP to comply with the Regional Transportation Functional Plan (RTFP). The two RTFP requirements evaluated include:

- Arterial and Collector Spacing
- Local Street Network for Vacant Land

ARTERIAL AND COLLECTOR SPACING

To comply with the RTFP, local jurisdictions must "include, to the extent practicable, a network of major arterial streets at one-mile spacing and minor arterials or collectors at half-mile spacing" (Reference 1). The analysis must take into consideration barriers, including topography, existing development, and environmental protection. In addition, all analysis is limited to areas within the Urban Growth and Urban Reserve Boundaries and outside city limits.

The existing roadway functional classifications were analyzed in order to identify potential roadway projects necessary to meet the requirements for arterial and collector spacing. The spacing between major arterials, expressways, and freeways was measured to determine gaps greater than one mile. The same method was used to analyze spacing between minor arterials, collectors, and connectors and determine gaps greater than one-half mile. The maps showing roadway projects to fill gaps and deficiencies in the desired roadway spacing are color coded on the attached maps and listed in the attached spreadsheet (see Appendix 1). Gaps are areas where no roadway currently exists to fulfill the desired roadway spacing. Deficiencies are areas where there is currently a roadway but that is not classified as a major arterial or above and is necessary to meet the spacing requirement.

Upon identifying gaps and deficiencies, and documenting them on the maps, the identified transportation projects were cross referenced with planned projects to determine any overlap. Some roadway projects identified through this effort have already been identified by previously planned projects. In addition, the roadway projects were also cross referenced with the Metro RTP Mobility Corridors gaps assessments. The necessity for some identified roadway projects was confirmed by the 2035 RTP Mobility Corridors arterial gaps analysis.

LOCAL STREET NETWORK FOR VACANT LAND

To comply with the RTFP, local jurisdictions must "include a conceptual map of new streets for all contiguous areas of vacant or re-developable lots and parcels of five or more acres that are zoned to allow residential or mixed-use development" (Reference 1). All analysis is limited to areas within the Urban Growth and Urban Reserve Boundaries and outside city limits.

To help the County comply with this requirement, a GIS layer was created to show vacant and re-developable land within the UGB and Urban Reserve that is currently zoned as residential or mixed use (Vacant Parcels MU & R). This layer was then overlaid on the existing street network with respective functional classifications. Then, contiguous parcels and parcels greater than five acres were identified to determine whether those lacked an existing local street network. If so, a conceptual street network was identified. The roadway projects are labeled on the attached maps and listed in the attached spreadsheet (see Appendix 2).

Memorandum

TO: Susan Wright, Kittelson & Associates

FROM: Jamey Dempster, Sean McAtee, Beth Wemple

DATE: July 18, 2012

RE: Clackamas County TSP - Preliminary list of collector roadways for possible roadway classification change

---

This memorandum presents a preliminary review of roadway corridors with the Clackamas County functional classification of "collector." It identifies corridors where peak hour volumes indicate a higher-level "minor arterial" roadway classification may be appropriate. Kittelson & Associates requested preliminary identification of these roadways in conjunction with general review of roadway designations being conducted as part of the County's Transportation Systems Plan update.

The analysis was conducted using directional PM peak hour[1] roadway vehicle volumes from the Future Low Build modeling scenario. Two thresholds were used to identify collector roadways that were near or above recommended volumes for this roadway classification. The thresholds are:

- 450 to 550 vehicles per hour per lane: nearing recommended capacity; and
- Over 550 vehicles per hour per lane: at or above recommended capacity.

These thresholds were derived from our experience working with travel demand models. Typically, roadways in the collector functional class have an upper limit capacity between 500 and 600 vehicles per hour per lane (VPHPL). This assumption is supported by roadway capacities used in the Clackamas County travel model, which set collector roadway capacity at 520 VPHPL. A critical characteristic in the consideration of collector road designation is the presence of residential driveways. Traffic volume between 450 and 550 VPHPL makes residential driveway access difficult. Without design changes, it is very difficult to have residential access onto roadways with traffic volumes exceeding 550 VPHPL. Furthermore, volumes above 550 VPHPL suggest that such facilities are functioning as arterial roadways, serving a significant amount of through traffic. Using these thresholds, CS identified collector corridors suggested for further review. Corridors identified for further review are listed below, with numeration corresponding to maps presented in Figures 1-3.

[1] The model output of PM 2-hour peak volumes were converted to PM 1-hour volumes using a factor of 0.52, as recommended by staff at Clackamas County.

Federal Functional Class Definitions

Principal Arterials

Interstates – I-5 and I-205

- Interstates are the highest classification of Arterials and were designed and constructed with mobility and long-distance travel in mind
- Roadways in this functional classification category are officially designated as Interstates by the Secretary of Transportation, and all routes that comprise the Dwight D. Eisenhower National System of
- Interstate and Defense Highways belong to the Interstate functional classification category and are considered Principal Arterials.

Other Freeways & Expressways OR 224 (Milwaukie Expressway), OR 217, Kruse Way

- Roadways in this functional classification category look very similar to Interstates; their directional travel lanes are separated by some type of physical barrier, and their access and egress points are limited to on- and off-ramp locations or a very limited number of at-grade intersections.
- Like Interstates, these roadways are designed and constructed to maximize their mobility function, and abutting land uses are not directly served by them.

Other Principal Arterials US 26, OR 212, OR 213N (82nd), OR 43, OR 99E, OR 213S

- These roadways serve major centers of metropolitan areas, provide a high degree of mobility and can also provide mobility through rural areas.
- For the most part, roadways that fall into the top three functional classification categories (Interstate, Other Freeways & Expressways and Other Principal Arterials) provide similar service in both urban and rural areas.

Minor Arterials OR 224 (Outside the UBG), OR 211, OR 213s (South of Leland), OR 99E Between Oregon City and Canby and south of Canby, OR 551

- Minor Arterials provide service for trips of moderate length, serve geographic areas that are smaller than their higher Arterial counterparts and offer connectivity to the higher Arterial system.
    - In an urban context, they interconnect and augment the higher Arterial system, provide intra-community continuity and may carry local bus routes.
    - In rural settings, Minor Arterials should be identified and spaced at intervals consistent with population density, so that all developed areas are within a reasonable distance of a higher level Arterial.
- The spacing of Minor Arterial streets may typically vary from 1/8- to 1/2-mile in the central business district (CBD) and 2 to 3 miles in the suburban fringes. Normally, the spacing should not exceed 1 mile in fully developed areas

Major and Minor Collectors OR 224 South of Estacada,

- Collectors serve a critical role in the roadway network by gathering traffic from Local Roads and funneling them to the Arterial network.
- Generally, Major Collector routes are longer in length; have lower connecting driveway densities; have higher speed limits; are spaced at greater intervals; have higher annual average traffic volumes; and may have more travel lanes than their beneficial to reexamine these two fundamental concepts of functional classification.
- Overall, the total mileage of Major Collectors is typically lower than the total mileage of Minor Collectors, while the total Collector mileage is typically one-third of the Local roadway network

Local Roads

- Locally classified roads account for the largest percentage of all roadways in terms of mileage.
- They are not intended for use in long distance travel, except at the origin or destination end of the trip, due to their provision of direct access to abutting land.
- Bus routes generally do not run on Local Roads.

Relationship between Functional Classification and Travel Characteristics

Functional Classification	Distance Served	Access Points	Speed Limit	Distance between Routes	Usage	Significance	Number of Travel Lanes
Arterial	*Longest*	*Few*	*Highest*	*Longest*	*Highest*	*Statewide*	*More*
Collector	*Medium*	*Medium*	*Medium*	*Medium*	*Medium*	*Medium*	*Medium*
Local	*Shortest*	*Many*	*Lowest*	*Shortest*	*Lowest*	*Local*	*Fewer*
